Receiving Your Trees: When you receive your figs they will be boxed securely. If you are not ready to plant or if the temperatures are too cold, immediately place them in a sheltered location, safe from frost. A root cellar, basement, or garage works well. It's important choose a place where the temperature stays between 38°F and 45°F. This is important so the roots neither freeze, nor does it get warm enough to break dormancy. It is essential that the young tree roots have plenty of time to become established before the tree begins its spring limb growth and bud break.

Planting: Figs should be planted after all danger of frost has passed. Once established, trees damaged by winter temperatures will most often re-establish from the root once conditions warrant. Unseasonably warm winter temperatures may also cause early bud break which can then freeze and cause damage to the tree. Figs require well drained soils with plenty of organic matter added prior to planting. They tolerate a pH range of 5.5 to 8, but ultimately thrive in the 6-6.5 range. Their location should be situated at least 20 feet from buildings or other trees. They should be given a sunny location that is free of wind issues. **Figs do not like their roots disturbed, so don't loosen the soil around their roots. Do not amend the planting hole when planting figs.** If amendment is necessary, try to do it before the tree is planted and only around the planting site, not in the hole.

If gophers are a problem in your area, a wire gopher basket should be placed in the hole. This is especially important for fig trees, which are a favorite of gophers. Gophers are less of a threat to mature trees, but this protection could mean the difference between life and death for a young tree.

Two more factors must be considered before planting: wind and sun. If high winds will be a factor in your planting location, then the tree should be tilted slightly towards the wind's prevailing direction. Do not overdo it, a slight tilt will suffice. To prevent sun damage to your new tree consider using white Spiral Tree Guards (item #PBR681). Tree guards are preferred for fig trees to protect them from rabbit or ground squirrel damage.

Dig a hole twice as deep as the root system and two to three times as wide as the root system. Current research indicates that a saucer shaped hole with sides that slope gently upward, the same depth and three times the width of the root system stimulates the most root growth. Figs should be planted at the same depth as they were in the pot.

Backfill with the soil. Lightly compact the backfill with your hand, adjusting the tree gently so that the backfill reaches the original planting depth. The back fill should slope gently up so the crown of the tree is slightly higher than the surrounding soil, this will help prevent crown rot. Water the tree thoroughly and watch for settling. If undue settling occurs, elevate the tree very slightly to raise its height and release any subsoil air pockets. Figs like to be mulched, mulch them well and make sure the mulch starts 4” - 6” away from the trunk of the tree and extends a couple of feet past the canopy.

Fertility: Figs require little amendment. If they have less than one foot of new growth, add nitrogen at bud swell the following spring. Liquid Kelp (item #F1330) given as a foliar spray monthly during the growing season is beneficial.

Ongoing Tree Care: Staking may be necessary but should be done carefully. A young tree that struggles a little against the wind, without being blown over, develops tissue in its trunk that will strengthen the tree as it matures. Tightly staked trees that do not develop this tissue are at greater risk of wind damage as they grow older. Staking should provide emergency assistance to a young tree, but should not interfere with its natural capacity to resist wind. To properly stake your tree, drive two sturdy poles deeply into the ground on opposite sides of the tree from each other. The two poles and the tree should demarcate a straight line directly into the prevailing wind. Using a plastic tie or cord attached securely to each pole, create a loose harness that will allow the tree sufficient movement in the wind at least a
few inches in all directions. If rain is not timely, then occasional watering will be necessary.

Over-watering can kill young trees. Moist, workable soil is sufficient; soggy soil is dangerous and often fatal. As the tree matures, you will want to water deeply but infrequently; commercial orchardists water for more than 12 hours at a time, but sometimes only two or three times during a season. Do not prune fig trees heavily.

Spraying fruit trees during the dormant season is an important preventative to many diseases and pest problems. Traditionally fruit trees are sprayed three times a year: at leaf drop (Thanksgiving), during full dormancy (New Year’s) and at bud swell (Valentine’s Day). Log on to GrowOrganic.com or check out our catalog for more information and a selection of natural and organic dormant sprays.

**Container Growing:** Black Jack, Tiger Panache and Violette de Bordeaux figs are well suited to growing in containers. This allows you to grow these fruits in climates that are otherwise too cold or in small spaces.

Transplant the young tree into a 20” pot. To ensure that your tree’s roots do not get too hot, a smart pot (a 15 gallon smart pot is a perfect first container size) or a light-colored plastic pot are recommended containers. Ceramic is also highly suitable but can make transplanting difficult, however in areas with high winds the heaviness of the container will prevent the tree from blowing over. Another option in a high wind area or for more decorative appeal is to use a heavy cachepot over a smart pot or plastic pot.

Use a light potting soil that is not overly rich in nutrients. Figs do not like to be fertilized in their first year. Re-pot your container fruit trees every 3 - 5 years. For the first re-potting you may want to move the tree from a 20” pot to a 24” pot. Replace 1/3 of the soil each time you re-pot.

**Perishable Items (3-Day Return Policy):**

We guarantee the perishable items we sell to be in good, viable condition when we sell them. Perishable items include, but are not limited to, garlic bulbs, flower bulbs, seed potatoes, onion sets & transplants, bare-root trees, vegetable crowns... etc. if your perishable item arrives in substandard condition, please contact us within 3 days of the purchase date (or delivery date) and we will provide you with a refund of the purchase price (including shipping costs), or a replacement. Accordingly, we urge you to open any boxes marked as “Perishable” immediately upon receiving them. Because some perishable items can deteriorate very quickly, we cannot accept any claims beyond the 3-day time frame as it becomes too difficult to determine if these items were delivered in substandard condition, or if they turned into such substandard condition because of having been improperly cared for or stored once delivered.

**Limited Dormant Tree & Plant Guarantee**

*(When Planted in the Ground by April 1st)*

**Claim Deadline is June 1st** (with the exception of persimmon trees, which have a deadline of June 15th). Claims placed after June 1st (or June 15th for persimmon trees) will be denied.

Please note: Our trees will come to you topped off at approximately 3 ft. in height to put the tree's stored energy into root development vs. foliage production.

**What We Guarantee**

Our only guarantee is that your dormant tree/plant will arrive in good, viable condition and will leaf out by May 15th (historically 98% of our trees do). This guarantee is only available to customers who purchased their tree/plant directly from us, and who planted their tree/plant in the ground by April 1st (or temporarily in a pot if the ground in their zone was still frozen solid).

**What We Cannot Guarantee**

We cannot guarantee that your tree/plant remains alive & healthy, or bears fruit, as there are too many variables beyond our control in order to do so (i.e. soil preparation, planting, fertilization, weed & pest control, adequate irrigation and/or drainage, chill hours, compatible hardiness for your zone, proper choice of pollinator, etc).

**How to Request a Credit**

If your tree/plant does not leaf out by May 15th, please perform a scratch test by checking for green under the bark, a few inches over the graft. If the scratch test reveals a brown cambium, that means your tree/plant is dead or dying. Watch our video titled Bare Root (Dormant) Warranty on how to perform this simple test. If the scratch test revealed that your plant is dead or dying, pull it from the ground and take pictures of the entire tree/plant, including the roots. Submit your claim & pictures by using the “Return an Item” tool on our Customer Service page (or email us at helpdesk@groworganic.com) no later than June 1st (or June 15th for persimmon trees). We will review your claim and issue you a credit (not a refund) for the purchase price of your tree/plant (excluding shipping).*

(*) We reserve the right to not issue credit for items already replaced. We also reserve the right to require photographic evidence that the tree/plant was not killed by root rot, rodent or mechanical damage.

**Limitation of Remedy**

We warrant to the extent of the purchase price only that the seeds or plants sold hereunder are as described on the label within recognized tolerances. No other warranty is given, expressed or implied, of (1) the merchantability or fitness of the seeds or plants for any particular purpose, or (2) against loss due to any cause. We cannot accept any responsibility for the many uncontrollable growing and climatic conditions (soil preparation, fertilization, weed and pest control, temperature control, irrigation...etc.) that must be met to insure the success of your crop(s) or plants.

Water the trees regularly. Figs will drop their leaves if they do not receive adequate water. Drought stressed trees will not produce fruit. Fertilize them in spring after their first year of growing with an organic fertilizer that is lower in nitrogen and high in phosphorus, potassium and calcium. A fertilizer like Dr. Earth’s Bud and Bloom Booster 4-10-7 is a good container fruit tree fertilizer.

If you will be taking your tree inside for the winter wait until the tree is fully dormant, then bring the tree into a shed or garage where it will be cool but sheltered. The temperature should not be consistently above 45°F or dip below 15-18°F. If the temperature in an unheated garage or outbuilding will dip below 15-18°F it is recommended you wrap the tree in a frost blanket. Water the tree lightly once a month to prevent the soil from becoming dry and powdery. Once the tree breaks dormancy in the spring, bring it out immediately.
